

Pre-Visit Clinical Risk Summary

Patient Profile

Age: 58 years
BMI: 34.8 (Obese)
HbA1c Level: 9.2 % (Very High)
Blood Glucose Level: 265 mg/dL (Severely Elevated)
Hypertension: Yes
Heart Disease: Yes

Risk Assessment

Risk Level: HIGH
Estimated Risk Probability: 92%

Key Risk Drivers

- Very high HbA1c and blood glucose levels
- Obesity (BMI > 30)
- Existing hypertension and cardiovascular disease

Clinical Summary

This patient shows a critically elevated risk profile for diabetes-related complications. Persistently high glycemic markers combined with obesity and cardiovascular comorbidities suggest a high likelihood of disease progression without timely intervention. Close clinical monitoring, confirmatory diagnostics, and structured lifestyle and medical management should be prioritized.
